Addendum: handover deliverables I had not covered, and one correction

Correction

I had proposed deferring the 12-week perimenopause pathway because the master PDF lacks sets and reps. The handover calls the original .docx the **authoritative source for that pathway**, so the right move is to keep it as its own family ("Strong Through Midlife") and import it from the .docx, not defer it or rebuild it myself. Please upload that .docx and the other three PDFs.

1. Module compatibility matrix (VERIFIED arithmetic, heuristic minutes)

Full table: `module_compatibility_matrix.csv` (50 base x module combinations: base target sets, replaced, retained, module sets, final weekly direct sets, net change, longest receiving session).

- **Lower modules on Build & Grow, Lower Emphasis, Muscle Builder:** roughly neutral. Net -8 to +3 sets per week, longest session about 47-52 min. These combinations are fine.
- **Lower modules on full-body bases (Strength Foundations, Strong for Life):** +15 to +24 sets per week and about 71-81 min sessions, because the module's two sessions land on top of full-body sessions. Not recommended without a trim.
- **Upper modules:** all 20 combinations add sets (+13 to +28 per week) and push receiving sessions to about 70-91 min.
- **32 of 50 combinations exceed 60 min after merging without trimming.** Hence the mandatory trim-to-fit step.
- Counting caveat: primary muscles are credited in full, so multi-muscle moves (e.g. face pull: rear delts and upper back) are counted for both. Coaches need the conservative counting rule below.

2. Conservative counting rules (to show coaches)

1. Direct set = exercise whose listed primary muscle is the target, taken near the

prescribed RIR.

2. A compound credits its primary mover 1.0 and each secondary 0.5 (configurable).
3. Indirect work is tracked separately and shown as "approximate", never summed into direct totals.
4. Warm-up sets and sets with a discomfort flag are excluded.
5. Time-based and carry exercises are shown but not added to hypertrophy volume.
6. Review prompt (not block) above 20 direct sets per muscle per week, or if combined modules overlap a muscle. Thresholds are placeholders for the S&C reviewer.

3. Video and illustration licensing assessment

None of these can be marked approved. I did not open any licence pages in this session, so everything is "unknown" until checked; where the handover itself already says do not assume, I mark it that way.

Candidate	Status	What must be recorded before use
wger	UNKNOWN (open-source platform; licence is per asset)	Per-asset licence, attribution text, commercial use, derivative rights, evidence URL and date
RepDB dataset	UNKNOWN (repository, licence and commercial terms unconfirmed)	Current repo, licence file, commercial permission
MuscleWiki API	UNKNOWN (API terms and commercial pricing)	Written terms for production use; free evaluation does not equal production rights
	UNAPPROVED	

ZenithFits database	until footage ownership is proven	Owner, signed permission
YouTube / other platforms	UNAPPROVED for download, hosting, editing or redistribution	Creator permission; outbound search link only
Own filming or commissioned illustration	APPROVED path (fallback)	Model release, ownership, accessibility captions
Record per asset: source URL, owner, licence, commercial use, hosting/redistribution, attribution, derivative rights, expiry, evidence URL and date. Reject anything unresolved. Until then the app uses a search-query link only.		

4. Prioritised roadmap

Must-have (launch): versioned exercise/program IDs; immutable published prescriptions; the five Appendix B programs after S&C sign-off; workout player (warm-up, sets/reps/load, rest timer, cues, alternatives, logging); double progression with reason codes and user confirmation; missed-session and return rules; weekly dashboard (completion, volume by muscle, adherence); metric units; accessible text alternatives; screening and "stop and seek help" copy; privacy consent; video "none approved" fallback.
Next release: specialisation modules with merge and trim; compatibility warnings; optional readiness check; plateau and deload suggestions; equipment filters; illustrations or filmed video; Strong Through Midlife pathway (after the .docx and clinical review).
Optional: six-day pathway after volume review; training-block comparison; coach review; exercise favourites; offline-first logging polish.

5. Progression reason codes (for the engine)

`TOP_OF_RANGE_AT_RIR` (suggest smallest increase), `BELOW_REP_MIN` (hold), `RIR_TOO_LOW` (hold, ease off), `DROP_TWO_EXPOSURES` (hold or reduce, review recovery),

`NEW_EXERCISE_BASELINE`, `TECHNIQUE_FLAG`, `DISCOMFORT_FLAG`, `READINESS_LOW`, `MISSED_RETURN_REDUCTION`, `USER_DECLINED`. Weekly increases are never forced.

6. Decisions needing approval, in order

1. Treat Strong Through Midlife (the .docx pathway) as a separate family; upload the .docx.
2. Names: Lower Emphasis, Muscle Builder, Balanced Legs, Calves & Shins, Heavy Legs; upper modules as "Builder" names.
3. Retire Beginner Options A-D in favour of the master five (keep the cue library and Learn phase).
4. Module policy: overlay with the base pointer paused, and mandatory trim-to-fit.
5. One deload policy: suggestion-based.
6. Allow lower modules on full-body bases or restrict them (my recommendation: restrict).
7. Per-exercise increments (or placeholders 2.5 kg and 5 kg).
8. Which Coach Series files go in the launch build.
9. Who does the S&C and clinical reviews, and who checks Australian privacy and advertising rules.
